

What's in the water?

When you look at a wetland, you might see a few animals, some trees and other plants and water, but is that all there is?

Wetlands are also home to thousands of tiny organisms too small to see without a microscope. They live in the water and soil, and even on the plants and animals!

Look at the cup of water you've collected, does it look like there's anything living in there? Describe or draw what you see in your water:

Now look at your water with the microscope, do you see any living things now? Describe or draw some of the things you see with the microscope.
